

Claims

1. A treating method for coating material waste water characterized by irradiating coating material waste water with a micro wave to decompose scarcely decomposable substances contained in the waste water to easily decomposable substances and then feeding the resulting treated water to a biological reaction bath to subject it to biological treatment under aerobic or anaerobic atmosphere.
2. The treating method for coating material waste water as described in Claim 1, wherein the micro wave is irradiated for 1 to 60 minutes.
3. The treating method for coating material waste water as described in Claim 1 or 2, wherein a microorganism-fixed carrier is used in the biological treatment.
4. The treating method for coating material waste water as described in any of Claims 1 to 3, wherein coagulation and separation treatment by a flocculant or electrolytic treatment is carried out before the coating material waste water is irradiated with a micro wave.
